

A Package Manager For Supercomputers

Moritz Siegel

Why A Package Manager For Supercomputers?

Many installations of the **same** software but with different:

- ► Hardware
- Versions
- Compilers
- Flags
- Dependencies

Example MPI:

18 providers x 30 versions x 6 compilers x 22 flags x 31 dependencies =

= 2 Million variants on VSC-5 alone!

Three Spack Trees

VSC-4 Intel CPU skylake

VSC-**5** AMD CPU **zen**

AMD GPU **cuda-zen**

Default Spack Trees

The current spack tree is shown on the left of the command line **prompt**:

```
1 zen trainee00@155:~$
2 cuda-zen trainee00@155:~$
3 skylake trainee00@144:~$
```

On login the **spack tree** for the current architecture is set.

Packages from one tree do not work on other architecture!

Switch Tree

All spack commands work on the current tree.

Type skylake, zen or cuda-zen to switch to a spack tree:

```
1 zen trainee00@155:~$ cuda-zen
2 cuda-zen trainee00@155:~$ skylake
3 skylake trainee00@155:~$ zen
4 zen trainee00@155:~$
```

You are on the same node 155 the whole time.

Find Your Package

Find your package, like **openmpi**:

```
zen trainee00@155:~$ spack find openmpi
```

Use "@" to show specific **version** only:

```
zen trainee00@155:~$ spack find openmpi@3
zen trainee00@155:~$ spack find openmpi@4.1.4
```

All **python** packages have a leading "py-" like in **py-numpy**.

All **R** packages start with "r-" like in **r-brew**.

Hash

Add -1 to show the unique package **hash** too:

```
zen trainee00@155:~$ spack find -l openmpi@4.1.4
-- linux-almalinux8-zen / gcc@8.5.0 ------
3yligjt openmpi@4.1.4
...
```

Use **any** spack command with this hash, and a "/" in front:

```
zen trainee00@155:~$ spack find -1 /3yligjt
-- linux-almalinux8-zen / gcc@8.5.0 ------
3yligjt openmpi@4.1.4
==> 1 installed package
```

Old Hashes

Use spack search to search for a hash of an old VSC installation:

You get some similar modules on the **current** spack tree.

Compiler

Use "%" to only show packages **compiled** with **intel**, **gcc**, **aocc**, etc:

```
skylake trainee00@144:~$ spack find openmpi %intel
zen trainee00@155:~$ spack find openmpi %aocc
cuda-zen trainee00@155:~$ spack find openmpi %gcc
```

Combine "%" and "@" to show specific **compiler version** only:

```
zen trainee00@155:~$ spack find openmpi %gcc@9
```

Flags

Use spack find -v to see the flags of a package:

zen trainee00@155:~\$ spack find -v openmpi@4.1.4

Use "+" or "~" to show only packages that have/not have that flag:

cuda-zen trainee00@155:~\$ spack find openmpi +cuda

Dependencies

Use spack find -d to show the dependencies of a package:

```
zen trainee00@155:~$ spack find -d /3yligjt
```

Use "^" to only show packages **A** that depend on **B**:

```
skylake trainee00@144:~$ spack find -d py-numpy ^intel-oneapi-mkl
```

zen trainee00@155:~\$ spack find -d py-numpy ^openblas

Load Your Package

Use spack load to load your package:

```
zen trainee00@155:~$ spack load openmpi@4.1.4
```

Add the unique **hash** to load that **exact** package:

```
zen trainee00@155:~$ spack load py-numpy/4qshzxi
cuda-zen trainee00@155:~$ spack load py-numpy/bctcmkr
skylake trainee00@144:~$ spack load py-numpy/b3lgcbu
```

All these packages are python's **numpy**, but built for different architectures.

List & Unload

Type spack find --loaded to list loaded packages:

Unload a package with spack unload mypackage:

```
zen trainee00@155:~$ spack unload py-numpy/4qshzxi
```

Type spack unload to unload all loaded packages.

Spack Modules

Every package installed with spack creates a module file:

The **hash** at the end, like **k4glowk** is the same as in spack.

Exercises

- □ Login to VSC-4/5.
- ☐ Switch between the three spack trees **zen**, **skylake** and **cuda-zen**.
- ☐ Find a hdf5 variant compiled with aocc at zen.
- ☐ Find a **openmpi** with **cuda** support at **cuda-zen**.
- ☐ Find a **numpy** including **intel-oneapi-mkl** at **skylake**.
- Load any openmpi package, then list all the loaded packages.
- ☐ Find out what old package once was /asdc2mk.
